

Release information: Opera 3 2.98.00 – Server Edition (SE)

Pegasus is delighted to announce the availability of the Data Connector for SE with the release of Opera 3 2.98.00. This is another significant milestone in the development of Opera 3 SE, and further underpins our product vision/strategy, by providing customers with the ability to analyse their own datasets to another level and produce their own user definable reports and dashboards.

The Opera 3 SE Data Connector uses fast, secure and modern technology to access datasets, including bespoke development fields by using Odata. The Data Connector also has an efficient, effective and friendly data dictionary with pre-defined links to make it extremely easy to navigate and use.

Partners and Customers will be able to use business tools that support Odata such as Microsoft Power BI, Excel and Sharepoint for a variety of reasons including synchronisation, data manipulation business alerts and even Artificial Intelligence technology can also be used to answer any pressing questions. The Opera 3 Importer along with Opera's third party development tools can be used with the Data Connector to refresh the data.

For more information on the Pegasus Data Connector, including training, marketing assets, sales activities and pricing information please contact your Account Manager.
